# COMMERCIAL HARVEST OF FRESHWATER MUSSELS IN WISCONSIN:

APRIL 1 TO SEPTEMBER 30, 1991

KURT I. WELKE

Wisconsin Department of Natural Resources Bureau of Fisheries Management Prairie du Chien, WI 53821

# Commercial Harvest of Freshwater Mussels in Wisconsin: April 1 to September 30, 1991

Kurt I. Welke Wisconsin Department of Natural Resources Bureau of Fisheries Management Prairie du Chien, WI 53821

Objectives - To summarize the monthly harvest data of freshwater mussels from the Wisconsin - Iowa and Wisconsin - Minnesota boundary waters of the Mississippi River. To provide documentation of relevant statistics of the commercial musseling industry.

# INTRODUCTION

Commercial mussel harvest has been, and continues to be, of biological and economic significance to the freshwater mussel resource, and those who derive income from it in the Mississippi river bordering Wisconsin. Several authors have compiled comprehensive historical overviews of the mussel industry and its effect on mussel populations (Carlander 1954, Coker 1919, Davidson 1924, Knott 1980, Thiel 1981, Waters 1980). These references are largely qualitative due to the lack of detailed and comparable harvest data. The Wisconsin Department of Natural Resources initiated mandatory harvester and buyer reporting in 1986. These reports have been the basis for tracking the activities of the mussel industry. The volume and location of harvest, species content and disposition (live or dead) in the harvest, value of the fishery, number of licensees, and effect of regulatory actions have been documented. The information has proven valuable in examining trends within the mussel industry, in shaping management and regulatory actions, planning survey needs, and in helping corroborate results of population investigations.

### **METHODS**

Wisconsin resident mussel shellers and buyers, as well as lowa shellers harvesting under reciprocity agreements in Wisconsin waters, submit monthly report forms to the Department. This information is keyed into a Lotus computer program that summarizes harvest and sales by selected fields.

These fields include the take of each species by size and disposition for each month and pool. The program compiles weight, average price, and total value information for each sheller and buyer transaction to provide annual statistics. Reporting compliance is performed by program comparison of sheller to buyer records. Reporting failure or discrepancies are identified and written to separate files by using program macro features. Buyer records from Iowa are paired with Wisconsin sheller reports to verify weights and pool information when shells are sold out of state.

#### **RESULTS**

Harvest. - The 1991 harvest of commercial mussels reported to the Wisconsin Department of Natural Resources from commercial shellers and buyers was 722,219 lbs (361 tons). This represents harvest in the WI/IA and WI/MN waters of the Mississippi river. Harvest of mussels from inland waters was prohibited in 1991.

The total harvest from the river was an additional 15% to 17% greater than reported by either sheller or buyer sources (Table 1).

<b>Table 1.</b> Information origins for commercial mussels, 1991.	lly harvested
Reported harvest from sheller reports	596, 205 lbs.
Under reported or not reported from shellers	19, 046 lbs.
Using buyer reports (no sheller reports filed)	106, 968 lbs.
From Wisconsin shellers 15,809 lbs.	
From Iowa shellers 89,025 lbs.	
From unknown origins 2,134 lbs.	
Actual total harvest in 1991	722,219 lbs.
Reported by buyers as purchased from sellers Using sheller reports, with buyers cross-check;	598,104 lbs.
these lbs. taken but not sold, or sold out-of-state	124,115 lbs.
Actual total harvest in 1991	722, 219 lbs.

As a stopped tracking pool numbers off the shellers' reports in Jun (We will resume this stement for '92.) However, this into is still reflected in the Pool Tables (see Table 4.)

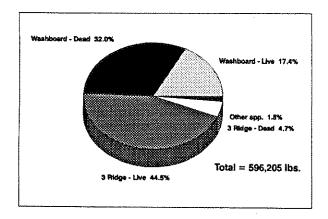

## Final aditing increased this ligure by 14,572 lbs (to 596,205 lbs)
Due to the nature of this editing, the increase is NOT reflected in the YTD Table.

Because shells can be held, sold out of state, or sold in Wisconsin from Iowa licensees, these harvest and sales activities lack a complimentary cross-check. Depending on the origin of the information, an additional 106,968 to 124,115 lbs. are attributable to either shellers or buyers. The sources of these additional shells are found in Table 1.

The harvest by shellers obligated to report by license condition and having complimentary buyers reports totalled 596,205 lbs. or 298 tons (Table 2, Figure 1). Similarly, Wisconsin licensed buyers reported purchasing 598,104 lbs. or 299 tons.

**Figure 1.** Composition of commercial mussel harvest from Wisconsin waters of the Mississippi River, 1991. (Data obtained from seller reports).

The harvest was equally divided between washboard (49%) and threeridge (49%) with fractional amounts of pimpleback and mapleleaf taken (2%). The monthly harvest distribution is given in Figure 2, with 78% of the harvest occurring from June through September.

The washboard harvest was 286,832 lbs., of which 100,954 lbs. (35%) were live shells, and 185,879 lbs., (65%) were dead shells. The majority of live shell was taken in the months of July and August (Figure 3).

For shells that had their origins reported, pools 10, 9, and 11 contributed 16%, 15%, and 12% respectively (Figure 4). Over half (53%) of washboards had untracked or unknown origins (appear as Pool 99) for the period July through August. The percent harvest by pool during April through June was applied to these months to estimate annual contribution by pool. Pools 10, 9,

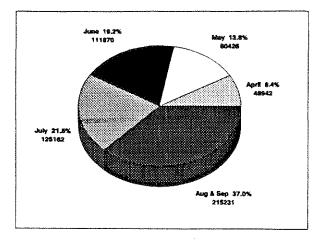

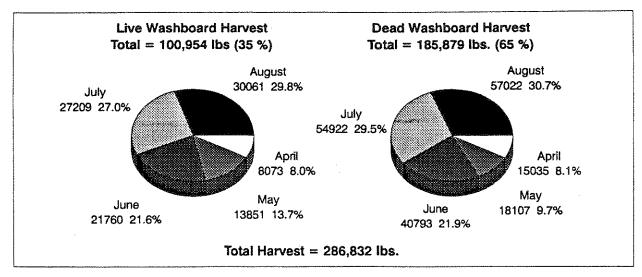

Figure 2. Monthly commercial harvest of mussels, 1991.

11, and 12 contributed 36%, 30%, 23%, and 11% of the undocumented washboard harvest. Table 3 presents the calculated contributions by pool for the total washboard harvest and the live dead components. Live and dead washboards were collected at similar rates and volumes (Figure 5).

The Threeridge harvest was 286,233 lbs. The majority (44%) of the harvest occurred in August and September (Figure 6). Pool 4A (Lake Pepin) accounted for 44% of the 1991 take (Figure 7). This late, localized harvest is due to the additional month of opportunity allowed in WI/MN waters, and the relatively high quality shell found here. Shellers shift their focus to Lake Pepin when WI/IA boundary waters close August 31, and buyers fill their remaining orders with Lake Pepin stock. Live and dead shell comparisons by pool are presented in Figure 8. The importance of the upriver pools are born out as pools 10 - 12 contribute only 8% of live threeridge and 20% of dead threeridge weight towards the total harvest poundage.

Buyer data summations by species, size, and disposition by pool and month are provided in Table 4. Values are generally comparable to those reported by shellers. The discrepancies in washboard weights largely represent shells purchased from lowa licensees. Threeridge harvest exceeded sales as markets became over supplied as the season progressed.

*Price.* - The total reported value of mussel shells bought by Wisconsin licensed buyers was \$513,556 (Table 5). Washboard receipts totaled \$430,595 or 84% of the reported value. Threeridge sales were

**Figure 3.** Monthly live and dead shell components of commercially harvested washboard mussels, 1991. (Data were obtained from seller reports).

valued at \$78,284. Average prices per pound were calculated by dividing weights of any given sized species and disposition by total dollars reported paid. Mean washboard prices ranged from \$.82/lb for dead, 3.5" (height) washboard to \$1.76/lb for live washboards, 3.5" in height and larger. Threeridge prices averaged \$.29/lb for both live and dead shell. The range of prices solicited from buyer inquires were from \$.50 for dead 3.5" washboard in May 1991 to \$ 3.75/lb for 4" washboard "cut-outs" (sheller processed shell with viscera removed) in September 1991.

Threeridge prices ranged from \$.20/lb to \$.30/lb. Threeridge shells 3" and larger which were cut-out demanded the highest price.

# DISCUSSION

Harvest. - The 1991 live washboard harvest was 28% greater than the 1990 live harvest. However, from the highest recorded live harvest of 526,674 lbs. in 1987, the 1991 harvest represents a 76% decline for the 5 year period (Figure 9).

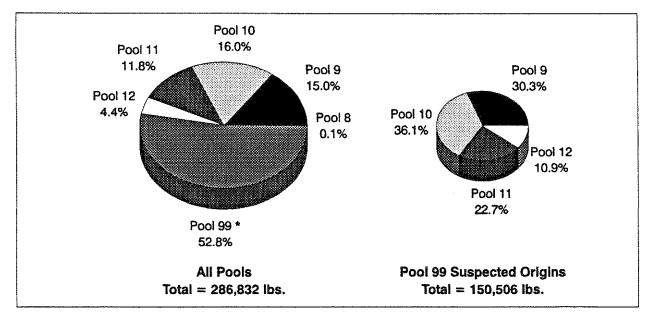

Figure 4. Pool distribution of live and dead shell components of commercially harvested washboard mussels, 1991.

WELKE 5

Table 3. Calculated contribution (%) of washboard mussel harvest by pool, 1991.

	Pool	9 Pool 1	0 Pool 1	1 Pool 12
Total harvest	32	35	24	9
Live shells	34	31	25	10
Dead shells	29	37	24	10

For the years 1988 and 1989, the washboard harvest was evenly split, with approximately 50% of the harvest contributed by live and dead shell components. With the institution of the 4" size limit, live shell volumes have declined to an average of 32% of the total washboard harvest.

Also of note is the shifting of harvest location and intensity. Pool 10 traditionally accounted for approximately 65% of the live washboard harvest,

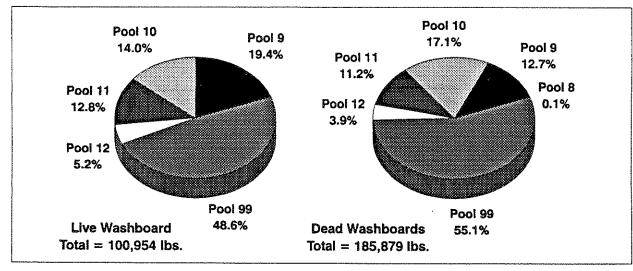

Figure 5. Pool distribution of live and dead washboards mussels commercially harvested in 1991. (Data obtained from sheller reports).

The combined effect of the 4" height size limit initiated in 1990 and declining densities of legal sized stock (Welke,1992) are evident when compared to the period of record presented in Figure 9. Despite stable numbers of shellers (Figure 11) and the offering of the highest recorded price per pound in 1991 (Figure 12), the resource was unable to supply the historical or contemporary demand.

Dead shell harvest decreased for the fourth consecutive year, attaining it's lowest level since 1987. This suggests that the availability of market quality dead shell is similarly limited. Lower volumes of dead shell, which occurred from natural mortality, corroborate the presumed decline in legal sized shells as well. Apparently less marketable dead shell was available because the supply had been pared down in previous years and the naturally occurring contribution continues to decrease simply due to the paucity of legal sized shell eligible to die. Live to dead ratios in the harvest continue to decrease as legal-sized shells become more scarce.

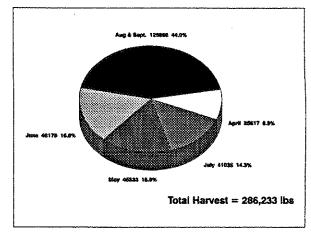

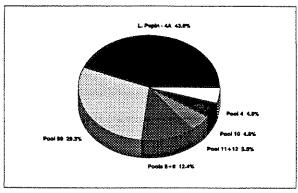

Figure 6. Monthly commercial harvest of threeridge mussels, 1991.

(Welke, 1990, and Welke and Miller, 1991). Pools 9 and 11 contributed an additional 15% each for 1989 and 1990. In 1991, pools 9 and 11 accounted for approximately 34% and 25% of the total live harvest respectively. The effect of long term, intensive harvest in pool 10 has necessitated the exploration

**Figure 7.** Pool distribution of commercially harvested threeridge mussels, 1991.

among producers will influence future harvest. It seems likely that as long as threeridge remain a cost effective "second choice" to supply the cultured pearl industry, that a harvest approaching the average experienced over the last 6 years will occur.

Price and Value. - The value of the Wisconsin mussel industry decreased for the first time since the current period of record, 1987 - 1991, Figure 13. This is due to the above average value of the 1990 harvest which was inflated by a large threeridge component. The value of the industry appears to

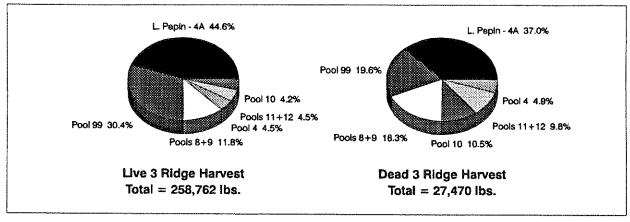

Figure 8. Pool distribution of live and dead threeridge mussels harvested from the Mississippi River, 1991.

and exploitation of washboard populations in other, more remote locations.

The harvest of threeridge has moderated from the record levels observed in 1989 and 1990 (Figure 10). The six year average take is 413,061 lbs., but the actual yearly harvests have fluctuated widely above and below this figure. The insecurity that existed in the market due to the dwindling washboard supply has fueled an expanding threeridge harvest since 1988. However, it is difficult to accurately speculate on the future demand for threeridge. It appears that future short term demand may have already been met by the enormous 1990 harvest.

If the Japanese and Pacific pearl producers can and will substitute the smaller threeridge nuclei in lieu of the nuclei from washboards, then one may anticipate a harvest on the order of what has been taken the last three years. Several variables such as consumer demand, alternate sources of raw material, economic stability, and competition

have reached an equilibrium of approximately one half million dollars annually.

# RECOMMENDATIONS

While the combination of market factors and size limits have contributed to a moderation of the harvest, there are certain problems that warrant consideration and action.

The shifting of washboard harvest pressure away from pool 10 to other pools necessitates the gathering of baseline density information in these locations. The intensified harvest of threeridge stocks from Lake Pepin merit quantitative survey work. This information would allow quantification of the effects of harvest and provide comparable data to that which exists for pool 10. These data have been the underpinnings of management actions.

**Figure 9.** Harvest comparison of live and dead shell Washboard mussels from the Mississippi River, 1986-1991. (Data obtained from sheller reports).

The Wisconsin mussel program still suffers from license revenues insufficient to coverharvest statistic compilation. Given the value of the resource, it would seem prudent to "plow back" some of the income from an increased license fee to enable self-sufficiency. Additional license fees could also fund some of the needed survey work which is not

currently possible within project planning and funding. This may also include inland work when necessary. A license increase would also bring Wisconsin into fee balance with Iowa, thereby reducing the problems associated with attracting shellers because of the existing fee difference between states. This may also help alleviate the

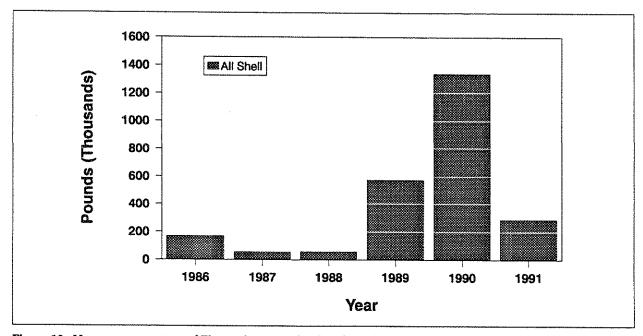

Figure 10. Harvest comparison of Threeridge mussels taken from the Mississippi River, 1986-1991. (Data obtained from sheller reports).

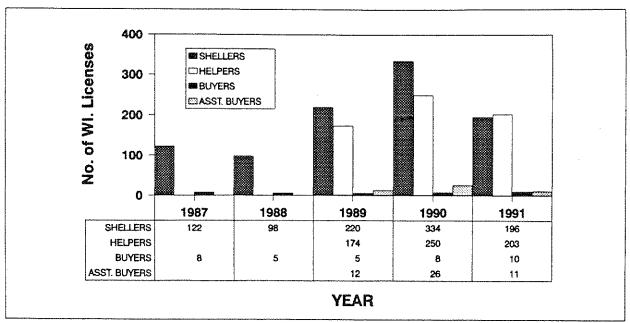

Figure 11. Number of mussel licenses sold to Wisconsin commercial anglers, 1987-1991.

ongoing problems associated with sheller residency. No impetus would exist to defraud the Department over claimed residency if fees were equalized.

The Department should continue its proactive role within the UMRCC ad hoc mussel committee. The adoption of a UMR - wide uniform reporting and regulation package, sponsorship of identification

seminars for law enforcement officers and biologists, and information transfer through the mussel symposium have all been positive endeavors. Future UMRCC activities will address the application of the computerized mussel harvest programs to yield basin wide comparable harvest statistics and quantifying the effect of zebra mussels on native mussels.
